ER Diagram

The system as built on branch `mini-erp` (Version 2.0): the three changes (Purchase Logic Draft2, QT Upgrade 2.0, User Version 2.0) are in. This replaces the older single-version description.

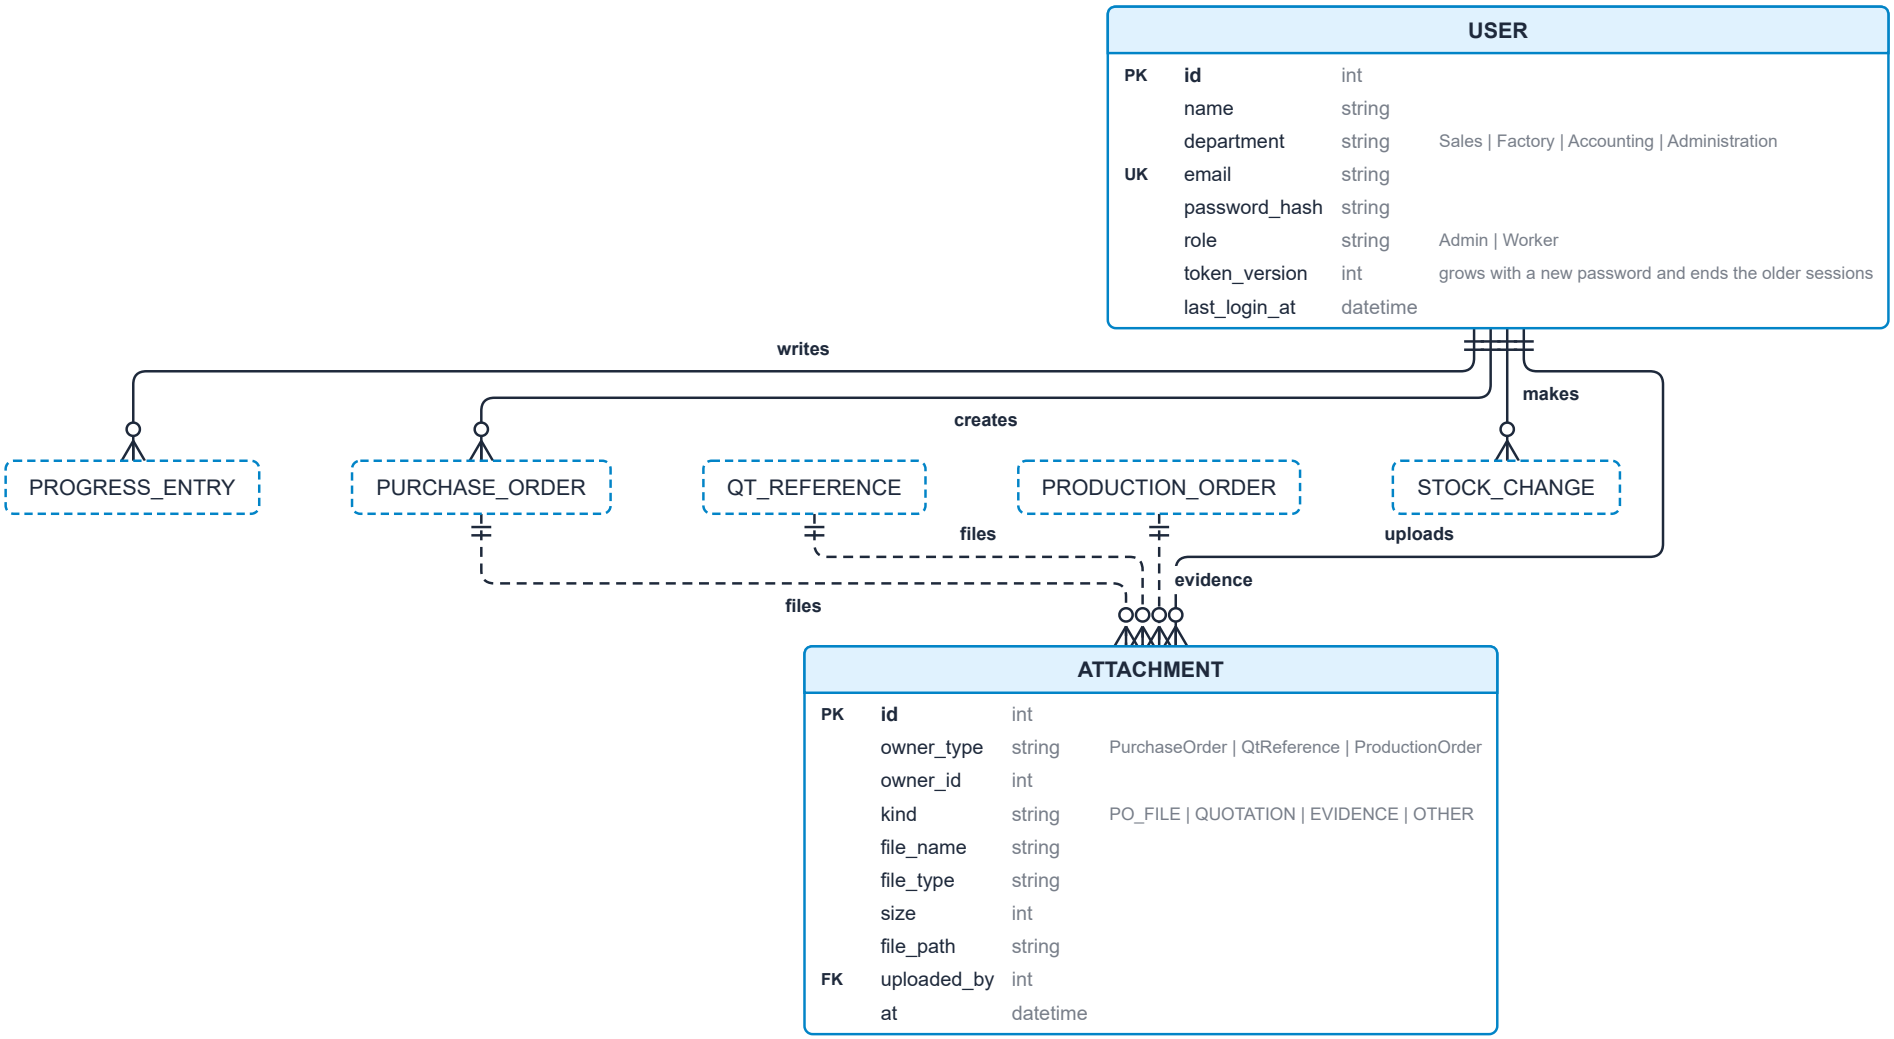

Figure 2. Users and files

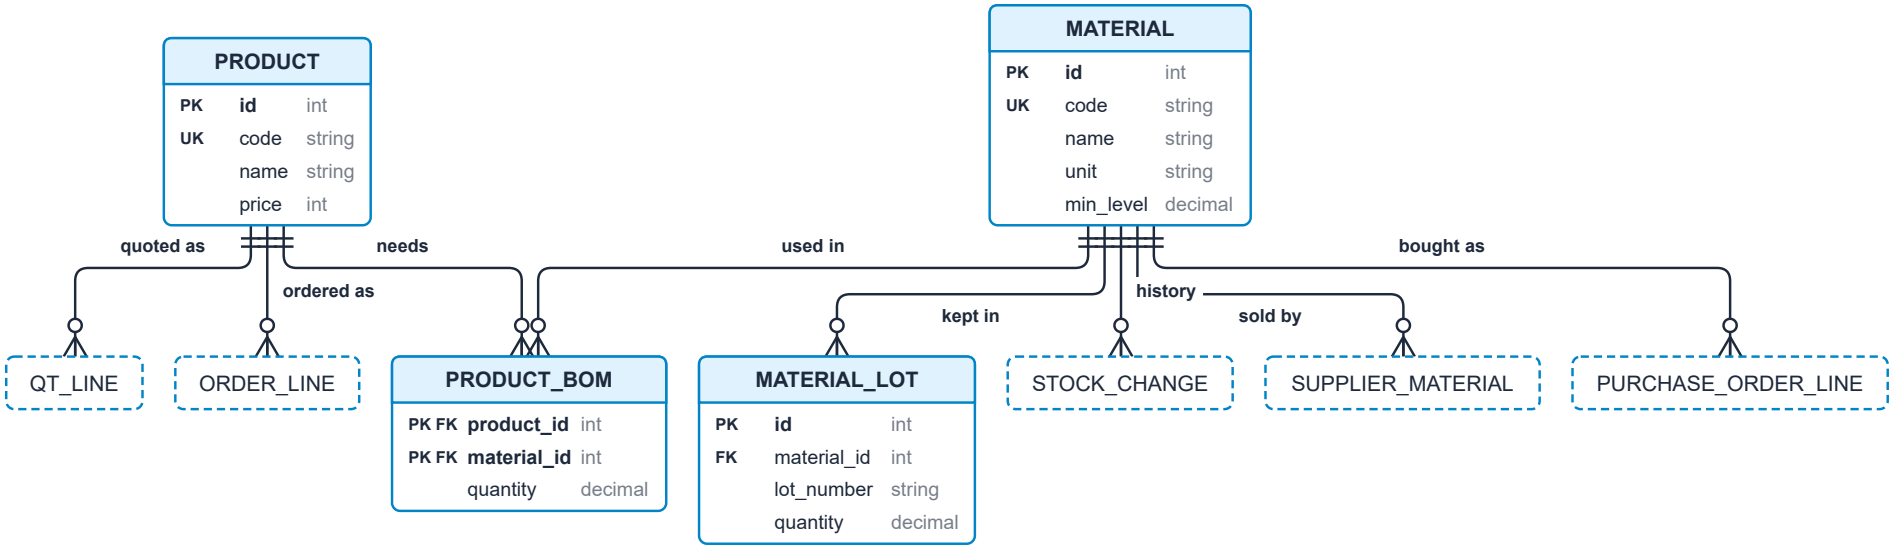

Figure 3. Master data: products and materials

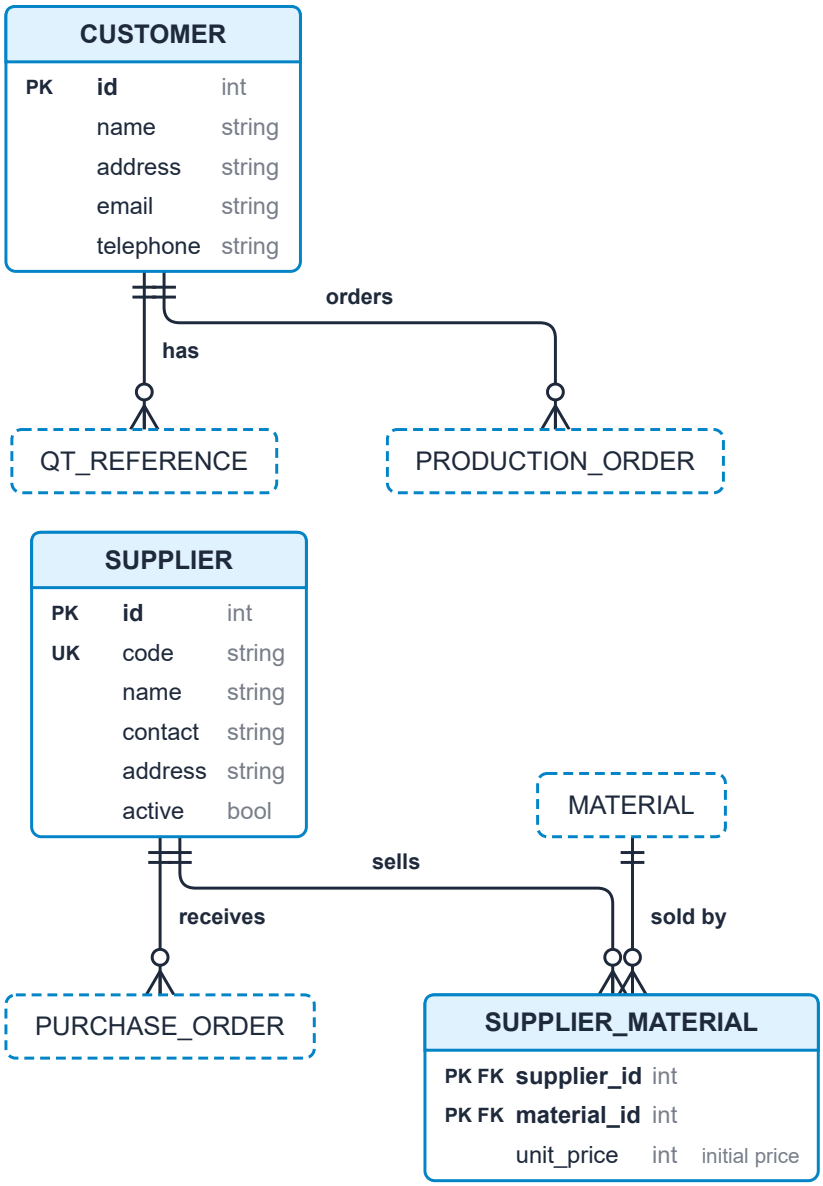

Figure 4. Master data: customers and suppliers

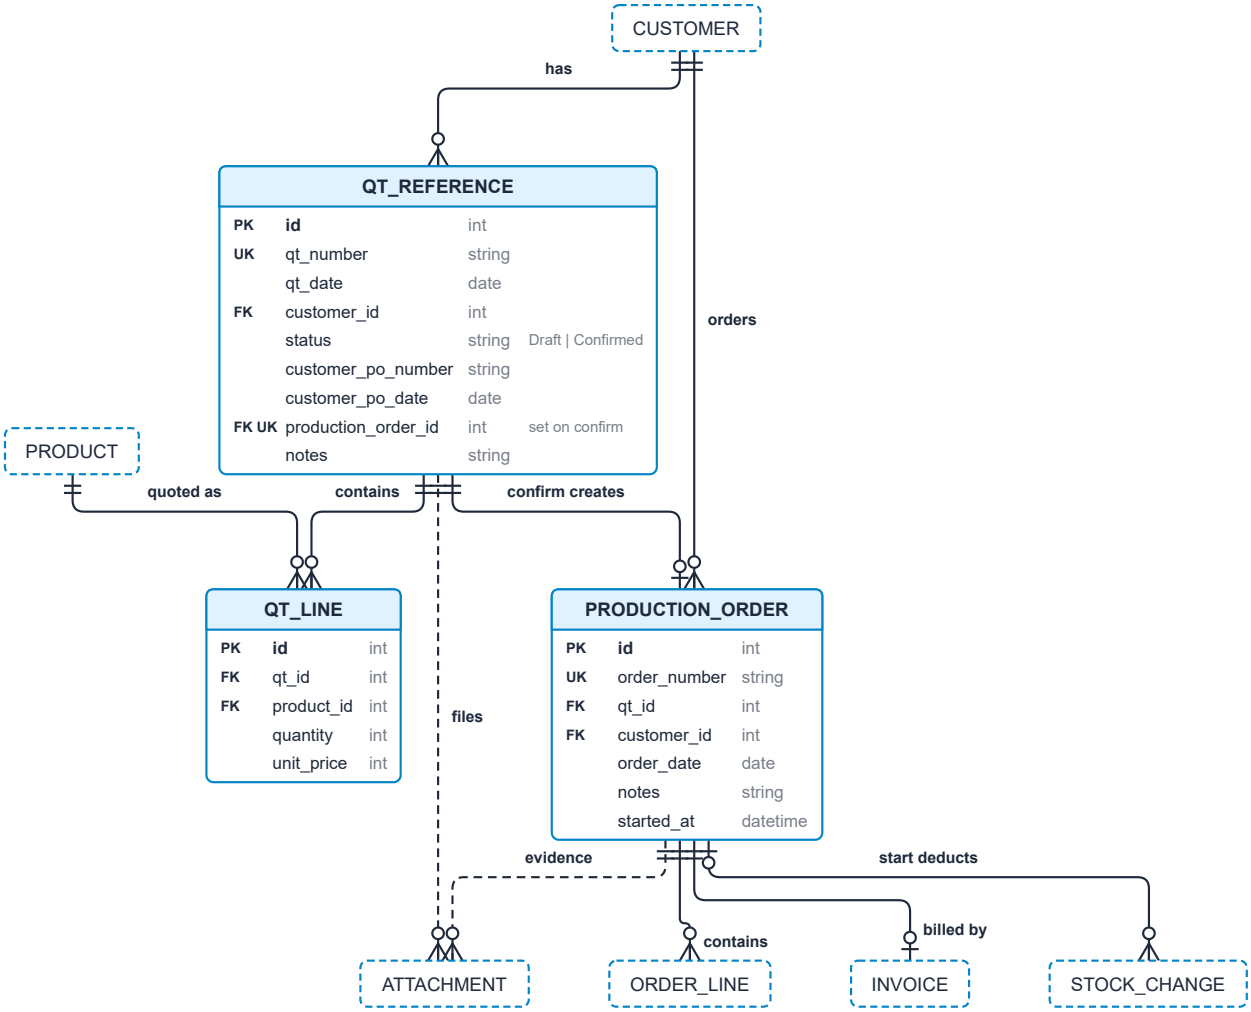

Figure 5. Sale: quotation

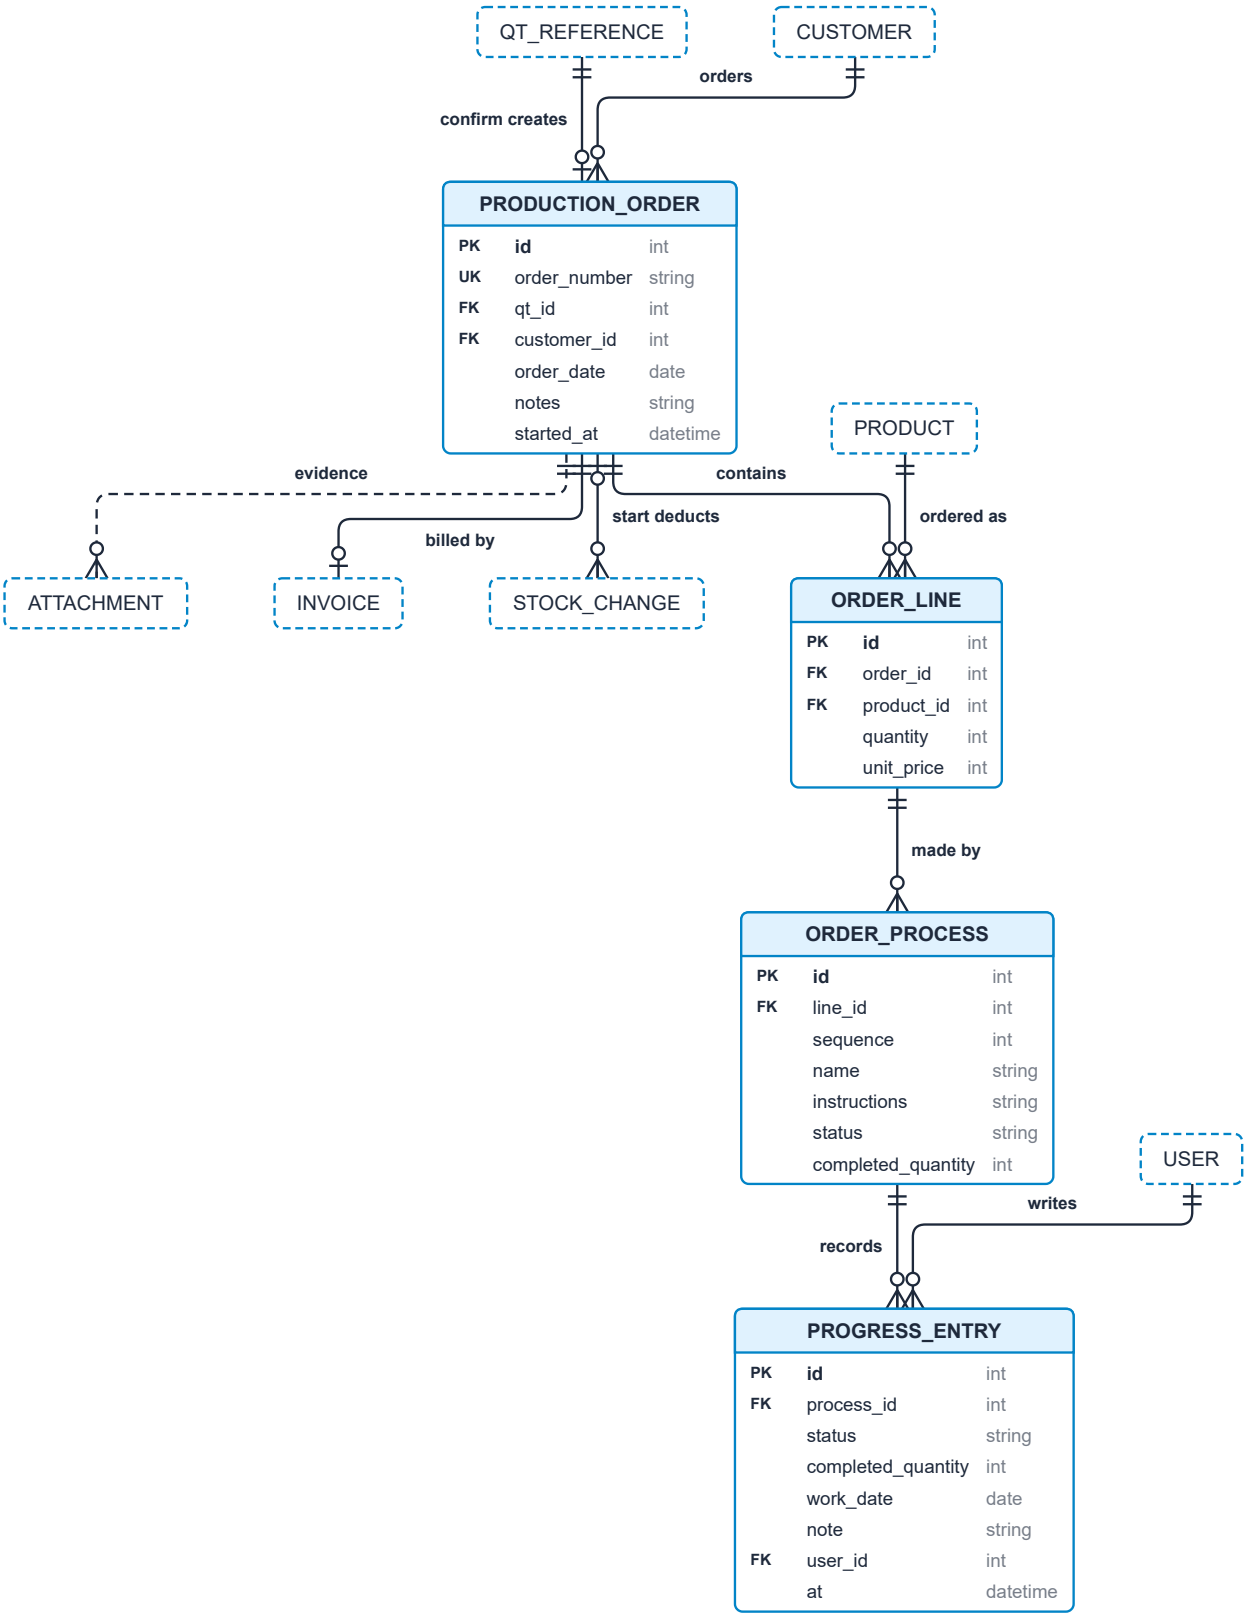

Figure 6. Sale: production order

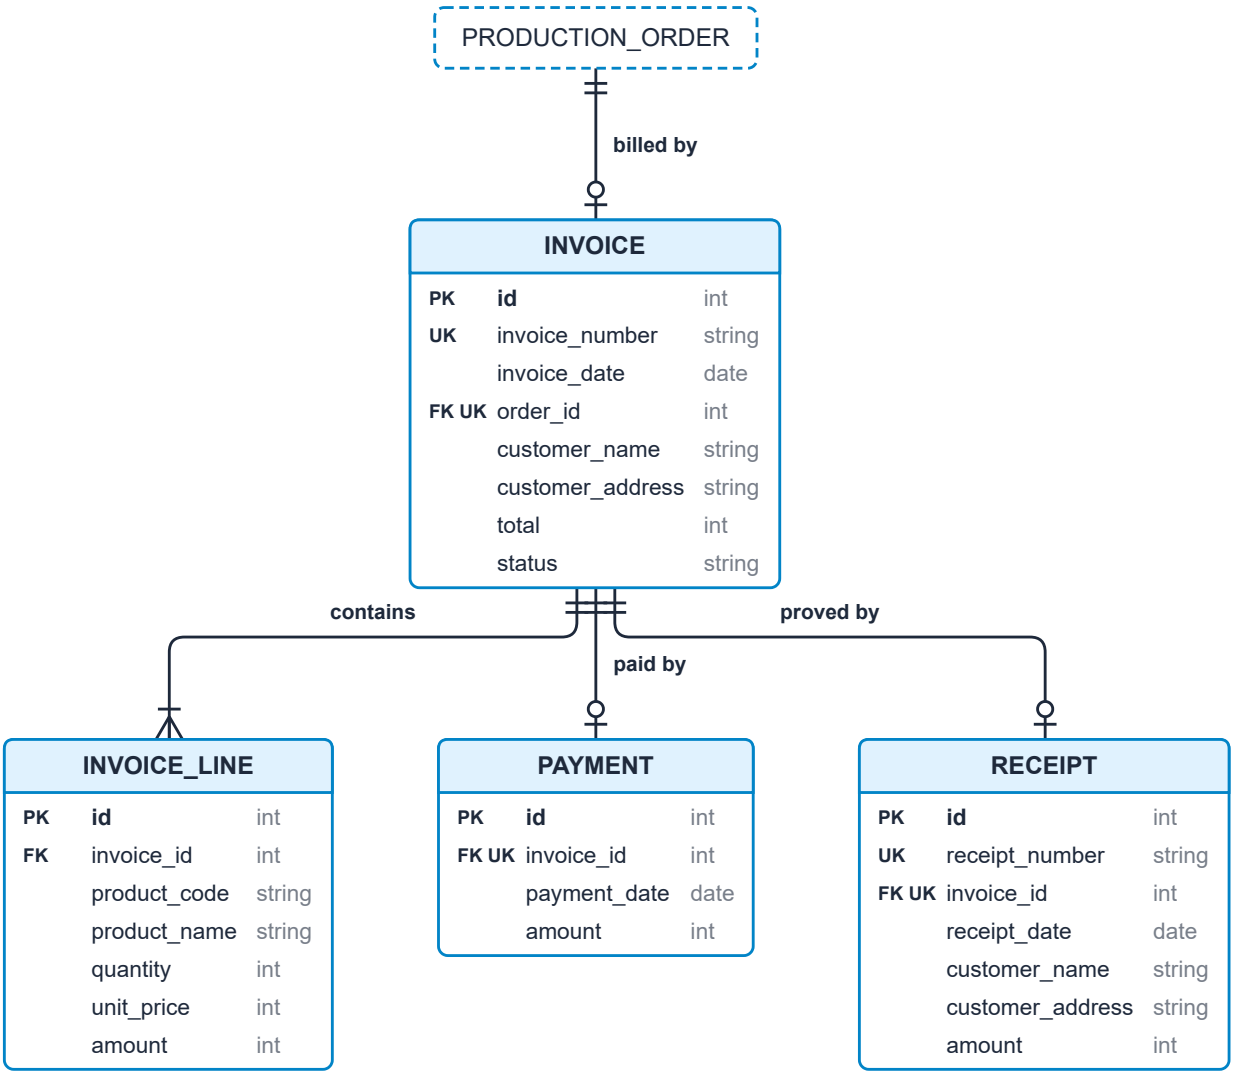

Figure 7. Accounting

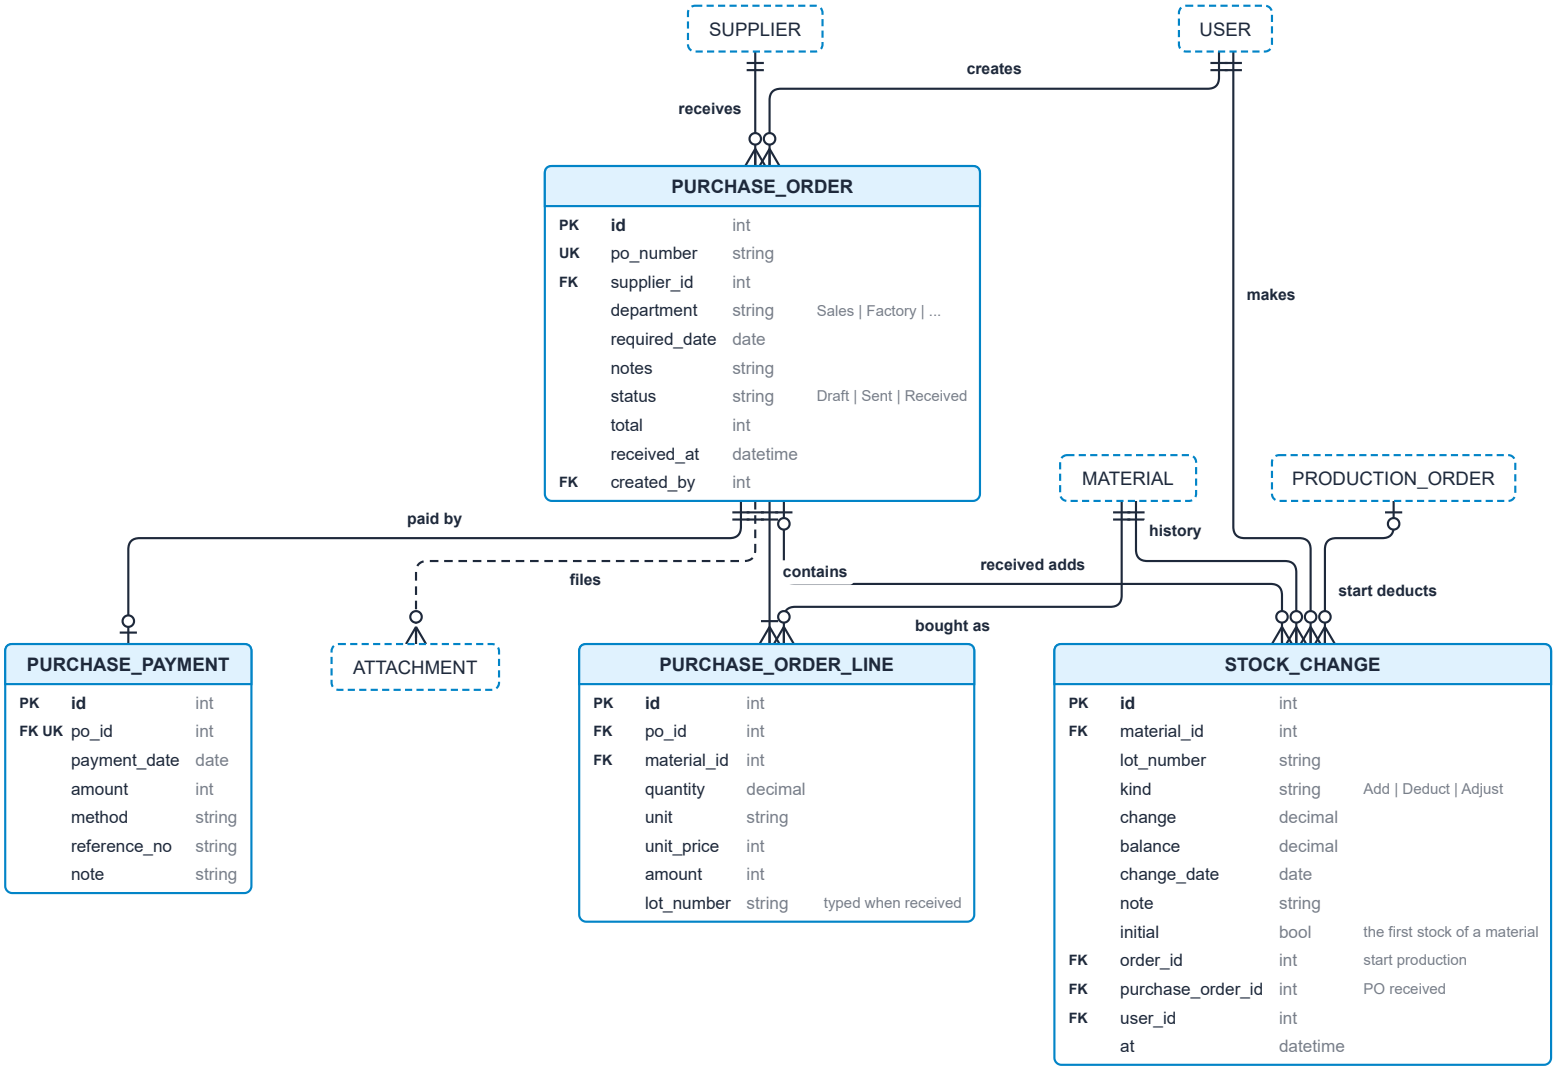

Figure 8. Purchase and stock

What Version 2.0 added

Source	Change
Purchase	New tables `Supplier`, `SupplierMaterial`, `PurchaseOrder`, `PurchaseOrderLine`, `PurchasePayment`. `StockChange.purchase_order_id` links a received PO to the stock it added
QT 2.0	`QtReference` gets `status`, `customer_po_number`, `customer_po_date`, `production_order_id`. New `QtLine`. The old QT file and the customer PO file move to `Attachment`
Files	New `Attachment` table, shared by PO, QT and production order (evidence). Replaces `file_name`, `file_type`, `file_path` on `QtReference`
User 2.0	No new column. A Worker's `department` must be `Sales` or `Factory` and decides access
Material	`unit` added (the PO lines need a unit)

Notes

- `Attachment` is polymorphic (`owner_type` + `owner_id`), so there is no database foreign key to the owner; the service checks it.
- `PurchasePayment` is stored on the PO and does not go through the Accounting tables.
- `QT_REFERENCE.production_order_id` is unique: one QT creates one Factory Order. It is the second link between the two tables, in the other direction of "confirm creates" (`ProductionOrder.qt_id`).
- `QtLine` has no stored amount: `quantity x unit_price` is computed by the API. The process, progress and invoice line tables list the columns the code has.
- `Order status` (`Draft`, `In Progress`, `Completed`) is **computed** from the processes; it is not a column. The stock status (`Normal`, `Low`, `Out`) is computed from the lot totals and `min_level`.
- `Invoice` and `Receipt` copy the customer and the product data when they are issued (a snapshot). An order is billed once, and an invoice has at most one payment and one receipt.
- An order is made only by Confirm QT, so `ProductionOrder.qt_id` is always set and each QT has at most one order.
- A QT, an order and an order line may have no line or no process for a while (zero or many in the database): the first QT line is required when the QT is confirmed, and a line and a process on every line when the order starts. A purchase order and an invoice always have lines.
- `StockChange.initial` marks the first stock of a material; a material with a later change cannot be deleted.
- `ProductBom` and `SupplierMaterial` have a primary key of two columns (`PK,FK` on both).
